For Immediate Release

World Environment On Maps of World

New Delhi, 11th February 2008: The most recent initiative of MapsofWorld, the World Environment, includes articles on different aspects of the natural environment. The site mainly focuses on highlighting key issues dealing with the threats to our surroundings.

The articles deal with different aspects of the natural environment. There are separate sections on Water, Air, Nature or Earth and Soil. The section on water deals with the process of Eutrophication and Sea Water Purification while the section on soil deals with Soil Guideline Value and Nuclear Waste Management.

The site also features a section on Earth/Nature that includes articles on Commercialization of Renewable Energy and Climate Change. Articles on burning environmental issues like Ozone Depletion and the phenomenon of Acid Rain also find a place on the World Environment at MapsofWorld.com. There is an interesting write up on Green Buildings. It brings to the forefront the necessity of constructing Eco friendly houses, the materials required for it as well as its long term utility.

The article on Soil Guideline Values enlightens the browsers about the substances that act as major soil pollutants. It also gives an idea of the degree to which these harmful materials can contaminate the soil. The write up on nuclear waste management also provides an insight into the safe and effective disposal of nuclear waste.

World Environment is one of the latest and most eagerly awaited ventures of MapsofWorld.

About MapsofWorld.com

MapsofWorld.com, is a global map site, managed by MapXL Inc. (a division of the holding company, Compare Infobase Ltd.). MapXL Inc. provides ready-made and custom maps for publishing, data sets, GIS services and content development services.
